

# Development of the Intensity and Quality of the Heavy Ion Beams at GSI

*L. Dahl, GSI - Darmstadt*

1. Accelerators and Beam Intensity Requirements
2. UNILAC: Upgrades and Beam Investigations
  - Front End Upgrades
  - 4th Order Resonances in the Alvarez Section
  - Emittance Transfer Experiment
3. SIS18: Beam Loss Reduction
  - Particle Losses by Ionization and Dynamic Vacuum
  - NEG Coating and Scrapers
  - New RF-Cavities, Faster Ramping
4. Conclusions

# Envisaged Beam Intensities for an U28+ Beam

required ions/60 $\mu$ s	measured ions/60 $\mu$ s	transverse emittances [ $\mu$ m]
$2.0 \cdot 10^{11}$ 15 emA		$\beta\gamma\epsilon_x = 0.8$ $\beta\gamma\epsilon_y = 2.5$

required ions/spill	measured ions/spill
$1.5 \cdot 10^{11}$	

required for SIS100 booster operation
$6 \cdot 10^{11}$ by 4 batches

70mA, 70 MeV/u

UNILAC

HESR

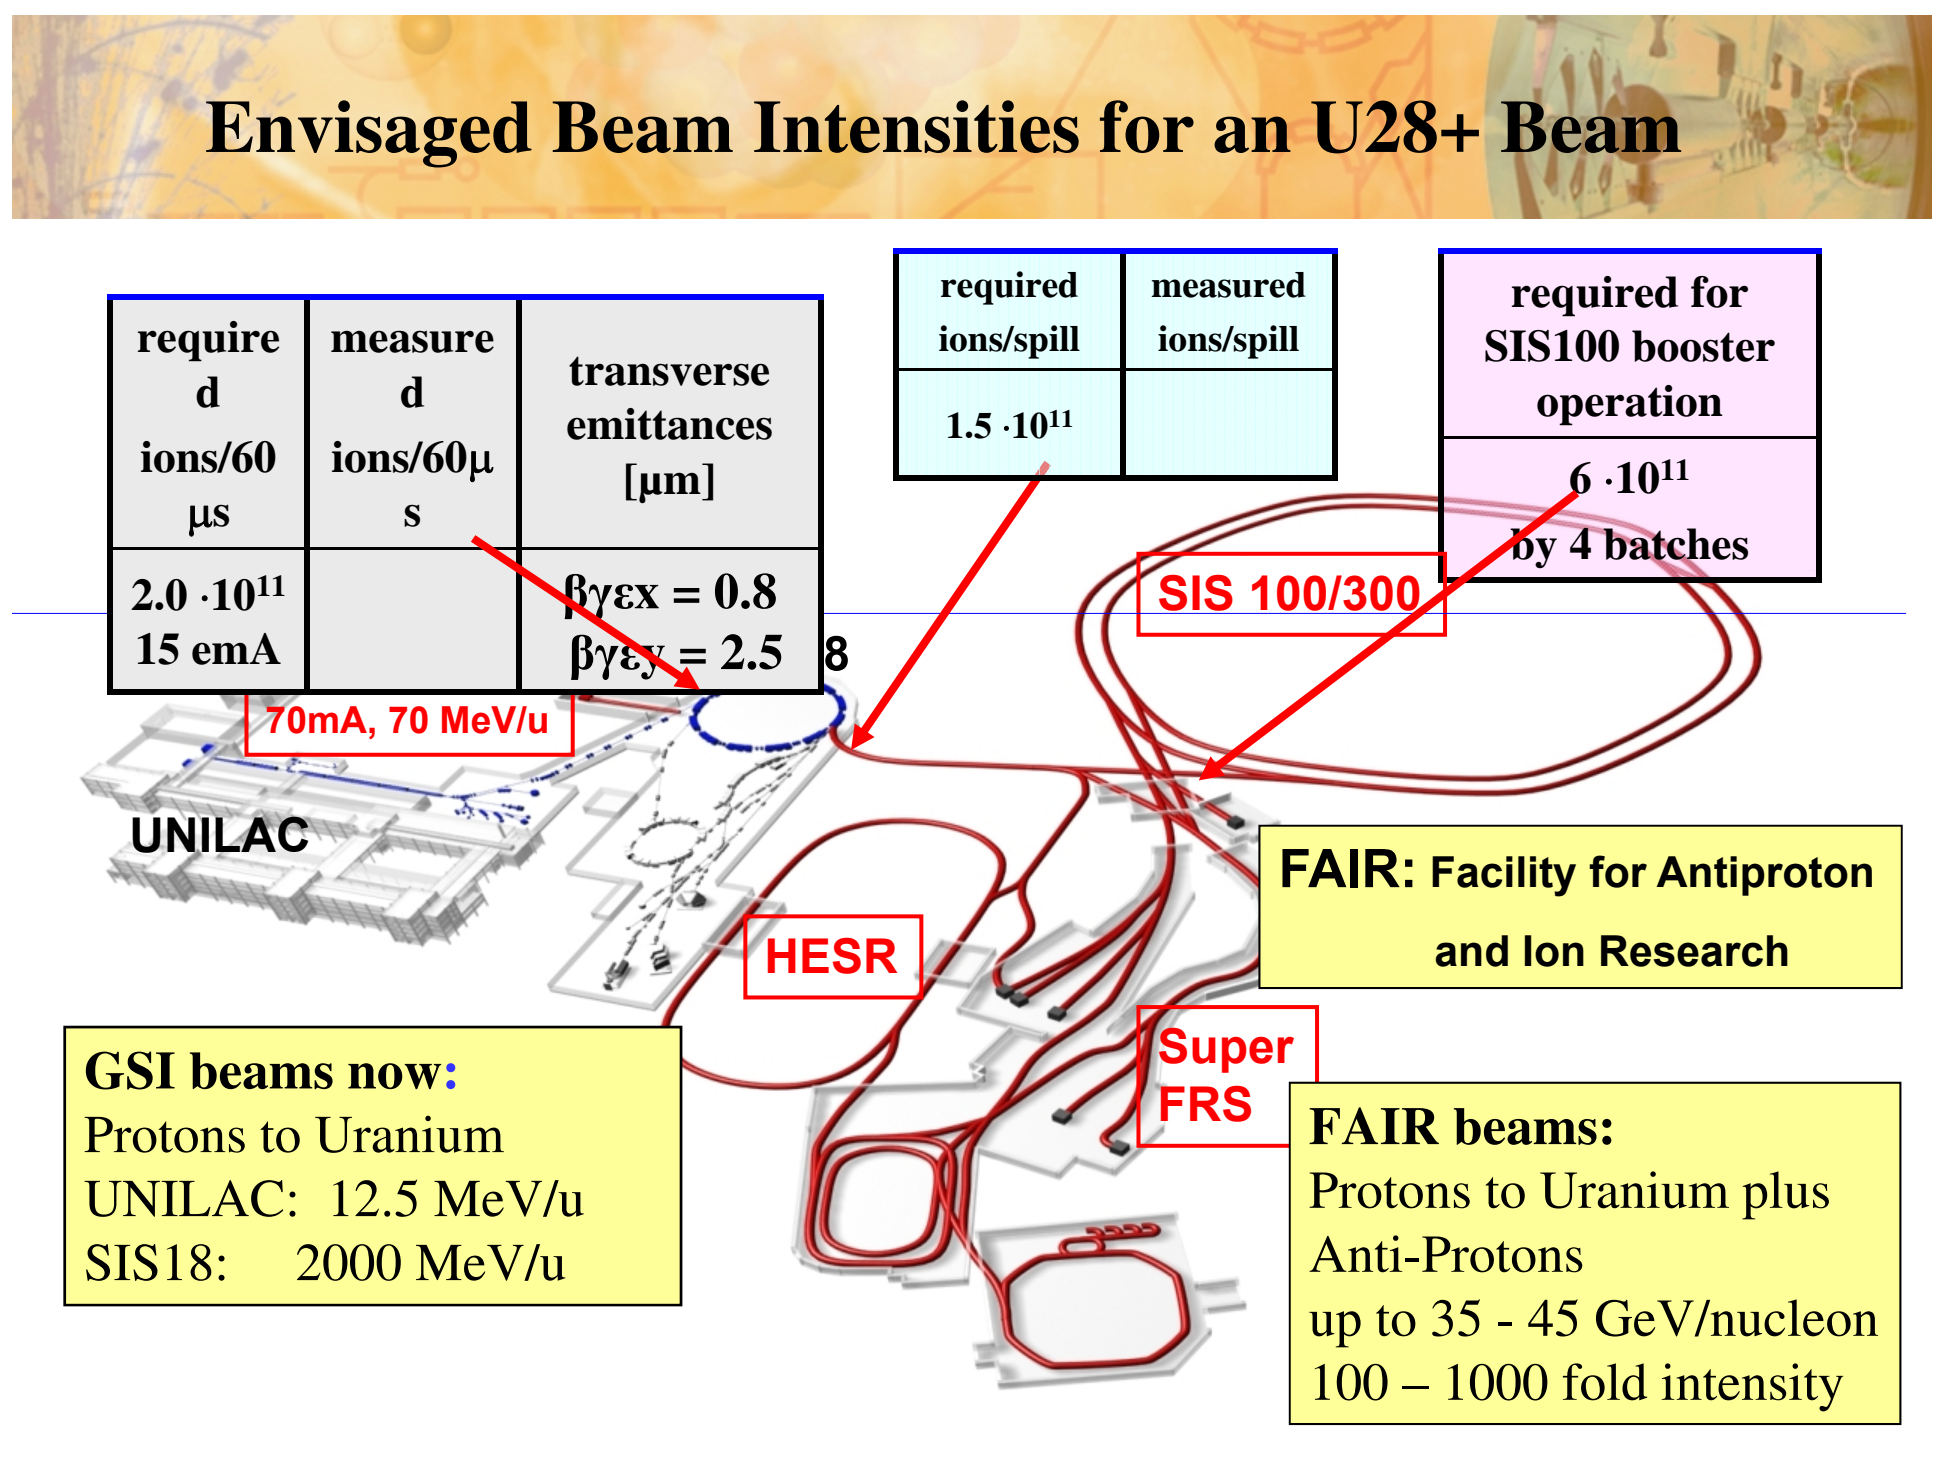

SIS 100/300

Super FRS

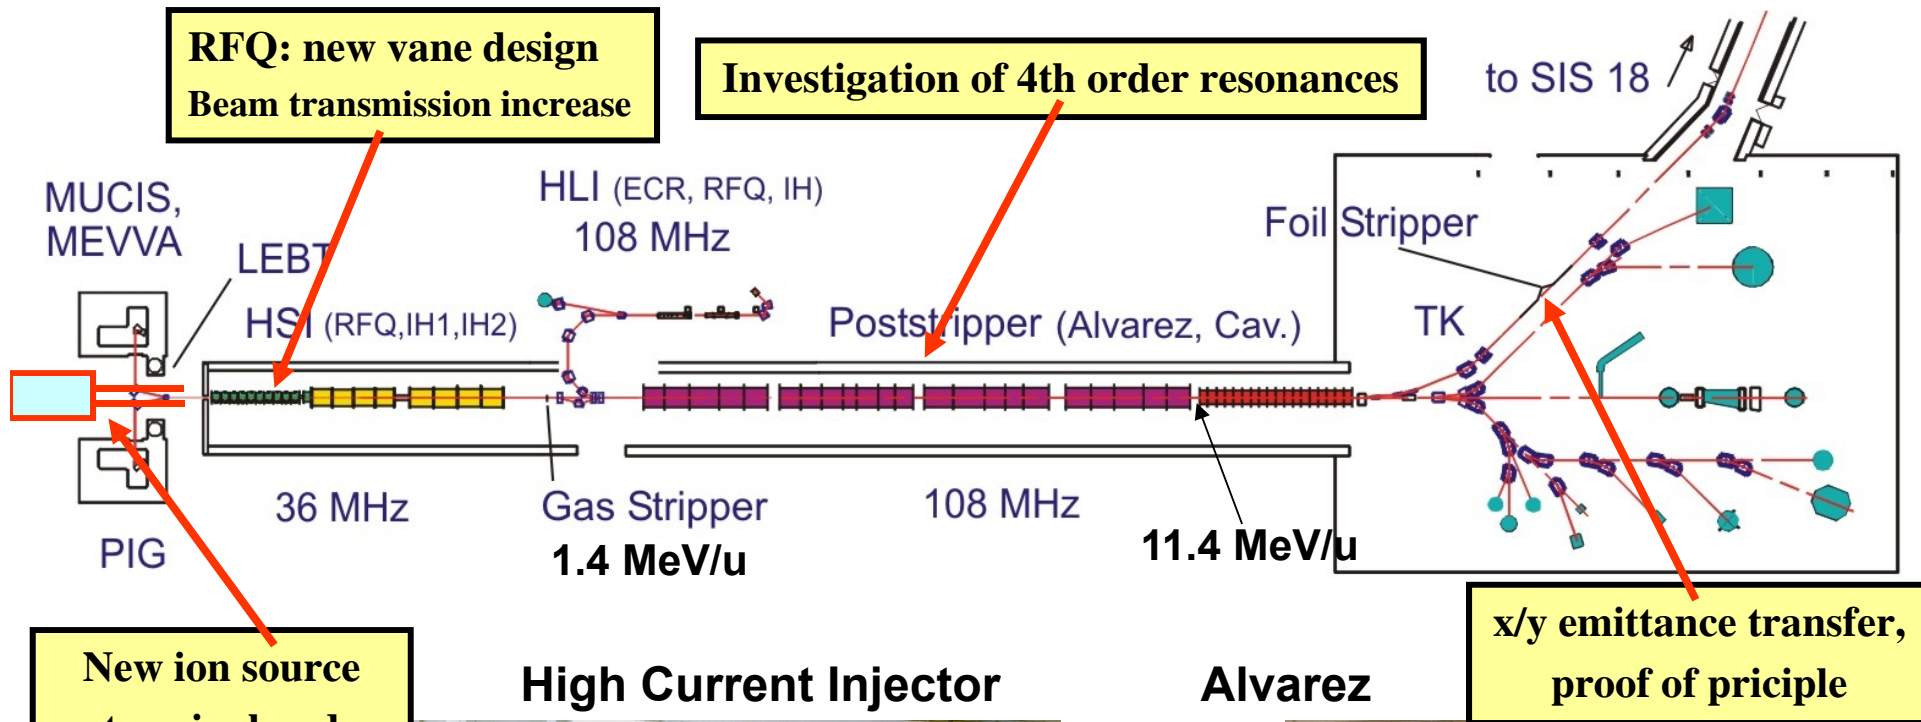

FAIR: Facility for Antiproton and Ion Research

**GSI beams now:**  
Protons to Uranium  
UNILAC: 12.5 MeV/u  
SIS18: 2000 MeV/u

**FAIR beams:**  
Protons to Uranium plus Anti-Protons  
up to 35 - 45 GeV/nucleon  
100 – 1000 fold intensity

# Beam Development at the UNILAC since 2009

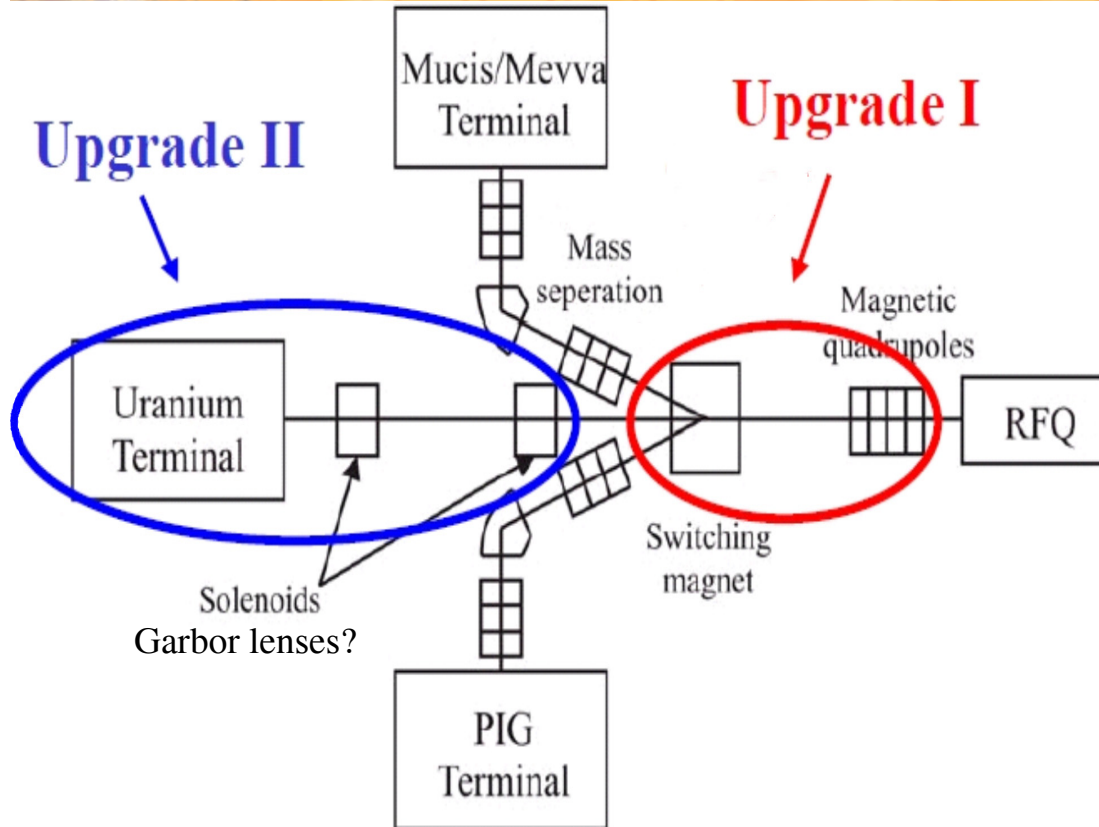

Development of the I

hl, HIAT, Chicago

# Planned New IS-Terminal and Compact LEBT

## Upgrade I

High current ion source test bench to develop highest beam brilliance.

Switching and quadrupole quartet magnets with increased aperture.

## Upgrade II (Compact LEBT)

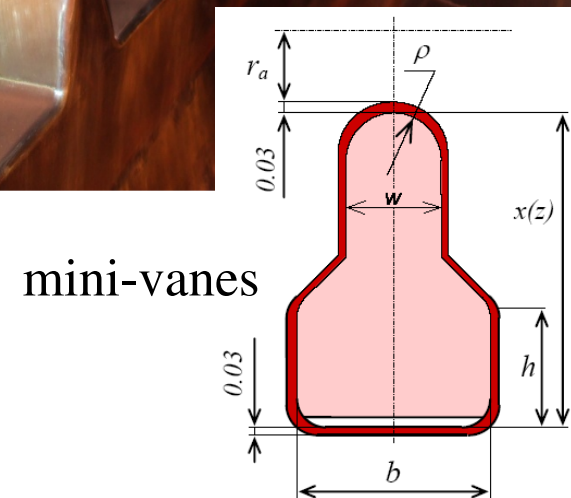

Sc solenoids or Garbor lenses for straight line injection of

**37 emA of U<sup>4+</sup> beam**

into the RFQ.

	MeVVA-ion source output	Entrance RFQ	Exit RFQ
Existing LEBT /RFQ	37 mA (U <sup>4+</sup> )	16.0 mA (U <sup>4+</sup> )	14.0 mA (U <sup>4+</sup> )
<b>Compact LEBT</b>	<b>37 mA (U<sup>4+</sup>)</b> <b>18 mA (U<sup>3+</sup>)</b>	<b>37 mA (U<sup>4+</sup>)</b> <b>18 mA (U<sup>3+</sup>)</b>	<b>20.3 mA U<sup>4+</sup></b> <b>1.6 mA U<sup>3+</sup></b>

# New Vanes for the 36MHz IH-type RFQ

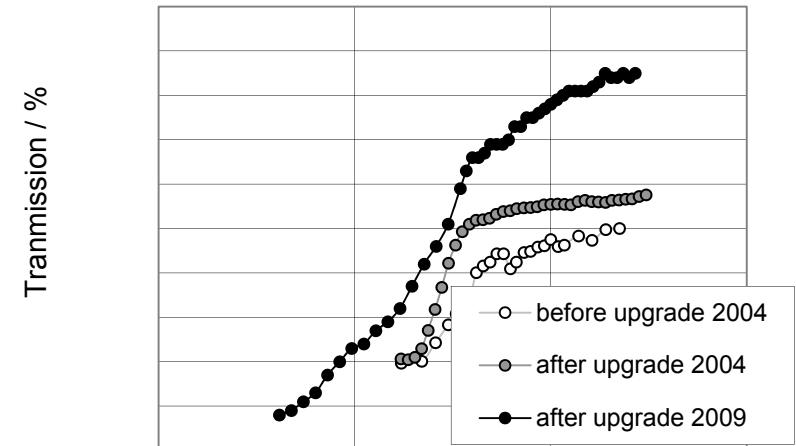

# New RFQ Parameters

	New Design	Old Design
Inter vane voltage, kV (U4+)	155	125
Maximum field, kV/cm	312.0	318.5
Modulation	1.012 – 1.93	1.012 – 2.09
Synch. Phase, degree	-90° - -28°	-90° - -34°
Aperture, mm	4.10	3.81
Norm. transverse acceptance, mm mrad	0.856	0.73
Output energy, keV/u	120	118.5
Number of cells with modulation	394	343
Length of electrodes, mm	9217.4	9217.4

- Higher transverse acceptance and phase advance
- Improved input beam matching
- Gentle bunching for rapid and uniform separatrix filling
- Beam dynamics studied with DYNAMION & PARMTEQ-M

HSI-RFQ Ar<sup>1+</sup> High Current Transmission

**Simulations:**  
**A. Kolomiets,**  
**S. Yaramyshev,**  
**R. Tiede**

# 4th Order Space Charge Driven Resonances

- Given a periodically breathing beam **envelope** with phase advance  $\sigma_{env}$  and radial symmetry
- **Single particles experience** constant external magnet focussing and electric field of beam size

$$r'' + \sigma^2 r = a \cdot r^3 \cdot e^{i\sigma_{env}s} \quad \text{depressed phase advance} \quad \text{approach : } r = e^{-i\sigma s}$$

$$\text{"New" oscillator equation : } r'' + \sigma^2 r = a \cdot e^{i(\sigma_{env}-3\sigma)s} \quad \text{frequency of effective perturbation}$$

$$\text{Resonance condition: } \sigma_{env} - 3\sigma = \sigma \quad \sigma_{env} = 4\sigma$$

envelope oscillates 4 times faster than single particle

$$\sigma_{env} = 360^\circ \rightarrow \sigma = 90^\circ$$

4<sup>th</sup> order resonance occurs at  $\sigma = 90^\circ$ , i.e.  $\sigma_0 \geq 90^\circ$

# Proof for 4<sup>th</sup> Order Resonance in the UNILAC

- DFFD periodic focussing channel with 180 quadrupoles
- Strong growth approaching  $\sigma_0 \approx 100^\circ$
- Tune depression:  $\sigma_0 \approx 100^\circ \rightarrow \sigma \approx 90^\circ = 360^\circ / 4$
- Good agreement with three simulation codes
- Strong hint for space charge driven 4<sup>th</sup> order resonance

7.5 emA, Ar<sup>1+</sup>

4 wings were observed

# Proof for 4<sup>th</sup> Order Resonance in the UNILAC

- First direct measurement of a space charge driven resonance in an accelerator
- Rings: slit/grid emittance measurement is not possible
- UNILAC: so far resonances considered to be of no concern for operation
- Evidence for enveloped-matched operation of the UNILAC DTL

# Beam Intensities for an U28+ Beam

required ions/60 $\mu$ s	measured ions/60 $\mu$ s	transverse emittances [ $\mu$ m]
$2.0 \cdot 10^{11}$ 15 emA	$0.8 \cdot 10^{11}$ 5.7 emA	$\beta\gamma\epsilon_x = 0.8$ $\beta\gamma\epsilon_y = 2.5$

required ions/spill	measured ions/spill
$1.5 \cdot 10^{11}$	

required
$6 \cdot 10^{11}$ by 4 batches

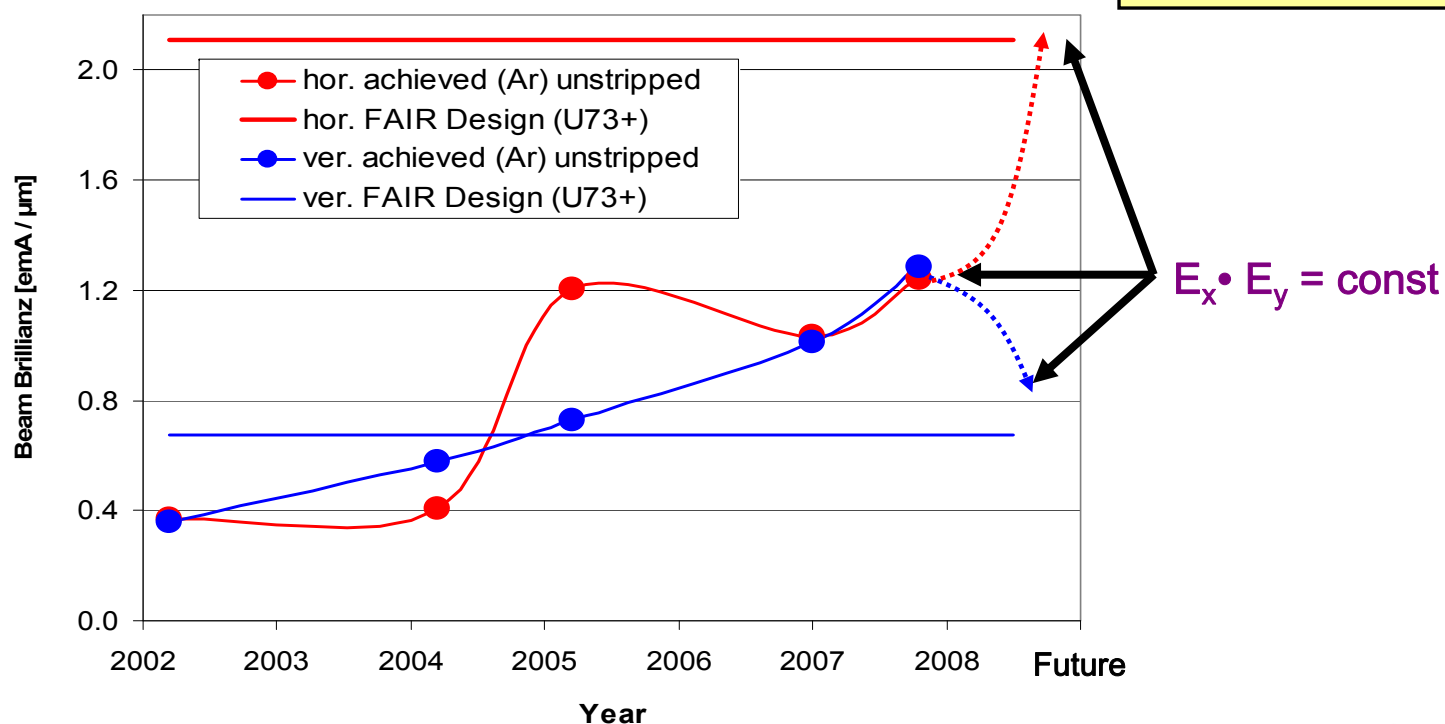

# How to Meet Horizontal and Vertical Design Brilliances ?

- present measured UNILAC brilliances are similar in both transversal planes
- emittance transfer from horizontal to vertical plane should help
- transfer should preserve  $E_x \cdot E_y$

Brilliance Definition:  $B_{x/y} := (q/A) \cdot \text{Current} / \text{Emittance}_{x/y}$

horizontally we are not ok  
vertically we are ok

# Emittance Splitting: Beam Dynamics

2d-rms-emittances

$$C_x = \begin{bmatrix} \langle xx \rangle & \langle xx' \rangle \\ \langle x'x \rangle & \langle x'x' \rangle \end{bmatrix}, \quad E_x^2 = \det C_x$$

$$C_y = \begin{bmatrix} \langle yy \rangle & \langle yy' \rangle \\ \langle y'y \rangle & \langle y'y' \rangle \end{bmatrix}, \quad E_y^2 = \det C_y$$

4d-rms-emittance

$$E_{4d}^2 = \det \begin{bmatrix} \langle xx \rangle & \langle xx' \rangle & \langle xy \rangle & \langle xy' \rangle \\ \langle x'x \rangle & \langle x'x' \rangle & \langle x'y \rangle & \langle x'y' \rangle \\ \langle yx \rangle & \langle yx' \rangle & \langle yy \rangle & \langle yy' \rangle \\ \langle y'x \rangle & \langle y'x' \rangle & \langle y'y \rangle & \langle y'y' \rangle \end{bmatrix} = \det C$$

two eigen-emittances  $\varepsilon_{1/2}$

$$\varepsilon_1 = \frac{1}{2} \sqrt{-\text{tr}(CJ)^2 - \sqrt{\text{tr}^2(CJ)^2 - 16|C|}}$$

$$\varepsilon_2 = \frac{1}{2} \sqrt{-\text{tr}(CJ)^2 + \sqrt{\text{tr}^2(CJ)^2 - 16|C|}}$$

$$J := \begin{bmatrix} 0 & 1 & 0 & 0 \\ -1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & -1 & 0 \end{bmatrix}$$

- without x-y coupling: eigen-emittances = rms-emittances
- with x-y coupling: eigenemittances  $\neq$  rms-emittances
- rotated, linear beam line elements, i.e. symplectic:
  - change rms-emittances through x-y coupling
  - do NOT change eigen-emittances !!!
- **eigen-emittances are preserved under symplectic („from a Hamiltonian“)**  
**transformation**
- **all rotated, linear elements are „from Hamiltonian“**

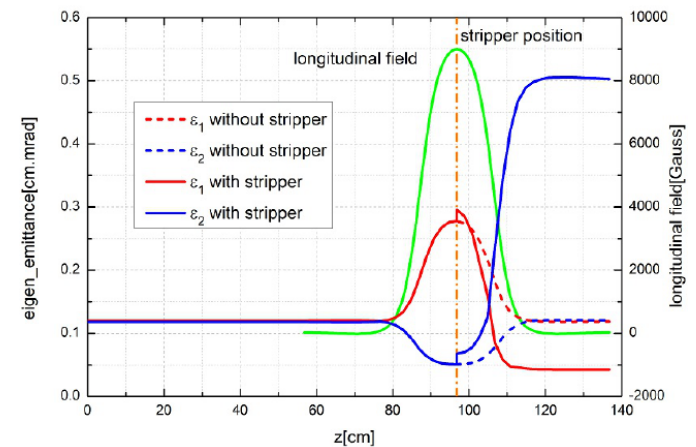

# Concept for rms-Emittance Transfer

1. start from a x-y uncoupled beam with equal transv. rms-emittances = eigen-emittances
2. apply a non-Hamiltonian, x-y-coupling action :
  1. create x-y coupling
  2. change the eigen-emittances
  3. change the rms-emittances
  4. rms  $\neq$  eigen !!!
3. apply a Hamiltonian x-y-coupling action to
  1. remove all x-y coupling
  2. re-optain rms = eigen
  3. remain with different transverse rms-emittances

a skewed quad-triplet will do the job

change of charge state inside long. mag. field cannot be described by a Hamiltonian

# Conceptual Layout of an Emittance Transfer Set-up

- set-up integrated around existing Charge State Separator
- comprises :
  - coil pair ( $B \approx \text{few T}$ )
  - skew triplet + doublet or triplet
  - diagnostic box with pepper pot

- Balance:
- Transmission: 100 %
  - $\Delta E_x$ : - 42 %
  - $\Delta E_y$ : +142 %
  - $\Delta E_{4d}$ : + 42 %

# Summary Emittance Transfer

- Emittance splitting might improve synchrotron injection efficiency without primary beam current increase and beam collimation
- Simulations: hor. emitt. reduction by n·10% possible
- Experimental proof of principle using  $H_3^+ \rightarrow 3p$  along UNILAC proposed

# Ionization Beam Loss and Dynamic Vacuum in SIS18

**Ionization beam loss is by far the dominating loss process for intermediate charge states.**

**It begins much earlier as space charge and current dependent effects.**

## Main Issue of the Booster Operation:

- Life time of  $U^{28+}$  is significantly lower than of  $U^{73+}$
- Life time of  $U^{28+}$  depends strongly on the residual gas pressure
- Ion induced gas desorption ( $\eta \approx 10\,000$ ) increases the local pressure
- Beam loss increases with intensity (dynamic vacuum)

# NEG Coating Facility

## Goals:

- Generation of extremely low static pressures of  $p_0 < 5 \times 10^{-12}$  mbar and increased average pumping speed by up to a factor of 100
- Stabilization of dynamic pressure to  $p(t)_{\max} < 10^{-9}$  mbar

- NEG: Non-Evaporable Getter, thin film of Ti-Zr-V
- Replacement of all dipole- and quadrupole chambers by new, NEG coated chambers
- Improved bake-out system for operation up to 300K

# SIS18 Upgrade Program for U28+ Booster Operation

NEG coated injection system

Scrapers and NEG coating for pressure stabilization

110 kV Power grid connection

h=2 acceleration cavity for faster ramping/cycling

# Injection System Upgrade

Final design of the new injection system

- Increased acceptance
- 280 kV for  $U^{28+}$  at 11.4 MeV/u
- Protection of septum electrodes (1.5 MW beam power)
- No HV break downs
- Reduced ionization beam loss
- Aim for reduced gas production

## Project completed

# Charge Catcher System - Technology

## Goals:

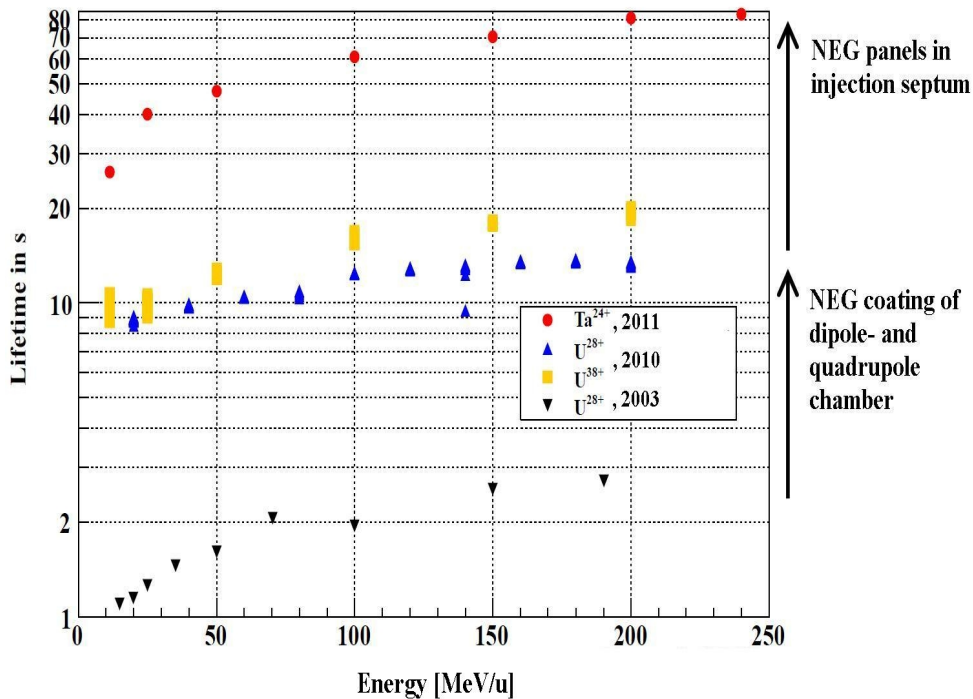

- Minimization of desorption gas production
- Capture and removal of desorbed gas
- Stabilization of the dynamic pressure

- **Wedge and block shaped beam stopper made of low desorption yield material tested**
- **Secondary chamber for confinement of desorption gases**
- **NEG coated chamber walls (high conductivity)**
- **Integration of UHV diagnostics and current measurement**
- **Two prototypes successfully tested in 2007 shut down**
- **Significantly reduced desorption yield**
- **Installation of series (10 catchers) completed.**

**Beam stopper**

# SIS18 Intensity Records with Intermediate Charge States

Beam intensity at SIS18 injection:  $0.30 \cdot 10^{11}$  p/60 $\mu$ s  
 at SIS18 extraction:  $0.21 \cdot 10^{11}$  p/spill

# Beam Intensities for an U28+ Beam

required ions/60 $\mu$ s	measured ions/60 $\mu$ s	transverse emittances [ $\mu$ m]
$2.0 \cdot 10^{11}$ 15 emA	$0.8 \cdot 10^{11}$ 5.7 emA	$\beta\gamma\epsilon_x = 0.8$ $\beta\gamma\epsilon_y = 2.5$

required ions/spill	measured ions/spill
$1.5 \cdot 10^{11}$	$0.21 \cdot 10^{11}$ only 2 emA injected

required
$6 \cdot 10^{11}$ by 4 batches

UNILAC-intensity 2007: 5.7 emA

2009: 8.6 emA scaled, but not proofed yet!

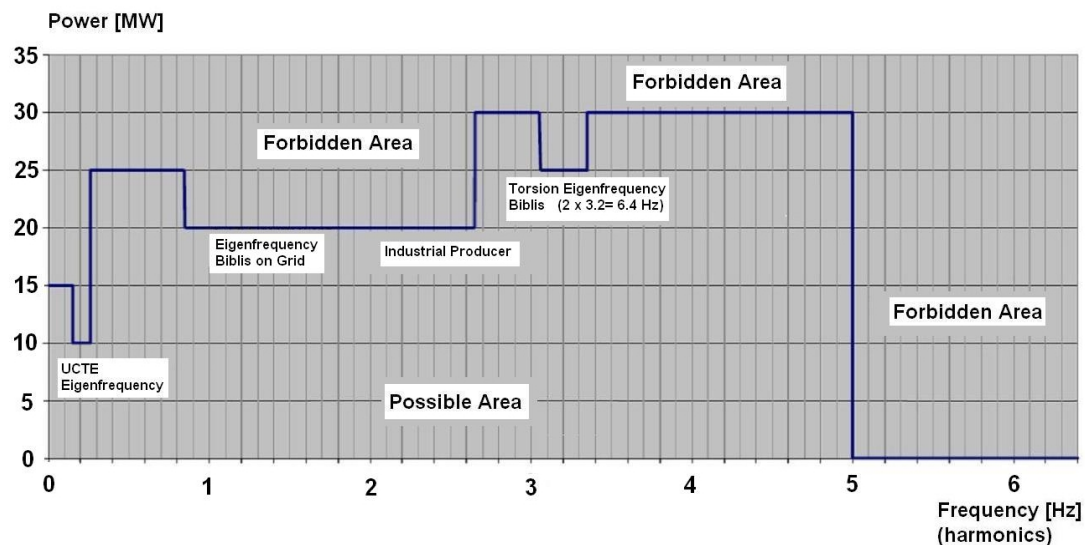

=> ~57 % of required 15 emA.

SIS18: 2.0 emA from UNILAC, achieved in 2010:  $0.21 \cdot 10^{11}$  ions/spill.

Scaling linearly UNILAC max intensity, SIS18 extracts  $0.9 \cdot 10^{11}$  ions/spill.

=> ~60 % of required  $1.5 \cdot 10^{11}$  ions/spill.

# New 110 kV Power Connection

	Pulse Power	Field Rate
SIS18	+5 MW	1.3 T/s
SIS18	+ 42 MW	10 T/s
SIS100	$\pm 26$ MW	4 T/s
SIS300	$\pm 23$ MW	1 T/s

- Study of electromechanical resonance (damping) of Biblis B generator shaft
- Measurements of torsion and power oscillation in the grid

**Replacement of main dipole power supplies  
for  $f_{\text{rep}} = 2.7$  Hz (2014)**

# New $h=2$ Acceleration System

- Rf voltage for fast ramping  
 *$U^{28+}$  acceleration with 10 T/s ( $2 \times 10^{11}$  ions)*
- Bucket area for loss free acceleration  
(30 % safety)
- *two harmonic acceleration*  
 *$h=4$  (existing cavity) and new  $h=2$*
- Compatible with SIS100 Rfcycle
- 50 kV – high power requirements
- Power consumption 1.6 MW
