Schoelkopf's law – Coherence 10x every 3 yrs!

On the threshold of error correction!

Reason to believe we can get to >1s!

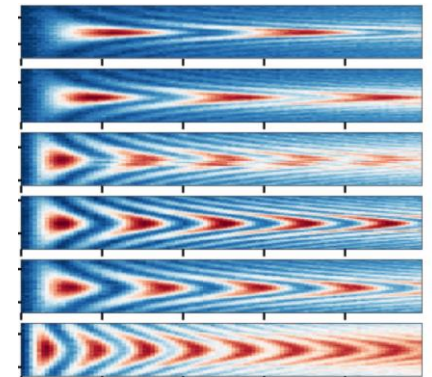

**Quantum Error correction is the equivalent of ignition
Where you get exponential gain with more fuel (qubits)**

Outline

- A modular architecture for superconducting quantum computing

- Multimode Circuit QED

- Universal local operations

- Deterministically transmitting quantum information

Microwave photons in a superconducting box

- If we take a single resonant mode of any of these boxes it looks like a harmonic oscillator

- Many types of “boxes”

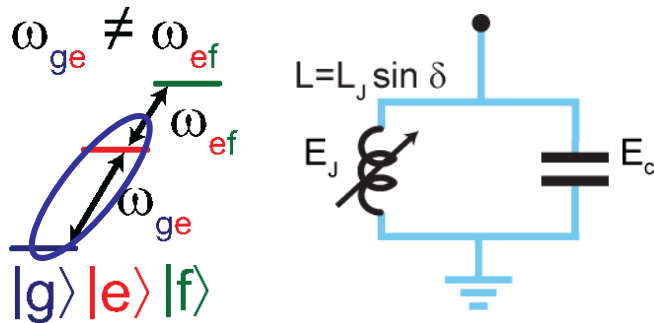

Superconducting qubits (two level system)

- Many flavors of qubit
- Key element is the Josephson Junction

Charge

Anharmonic Oscillator

- Junction acts as non-linear inductor
- Bottom two (or several) individually addressable

Transmon

Flux

A photonic modular architecture for SC qubits

Advantages:

- 10-100 qubits per module
- 10x fewer transmons, 10x less classical hardware
- Fully connected: 2 hops between any pair of bits, M-bits in parallel
- Compatible with hardware efficient error correction

Modular Universal Quantum Logic

- Single qubit gate (2 swaps)
- Intra-module two qubit gate (4 swaps)
- Inter-module two qubit gate (8 swaps)
- Only two types of operations (rotation and swap)
- Inter-module almost as fast as intra-module
- Can run M instructions in parallel

A network of two multimode-processors

2 chips each with:

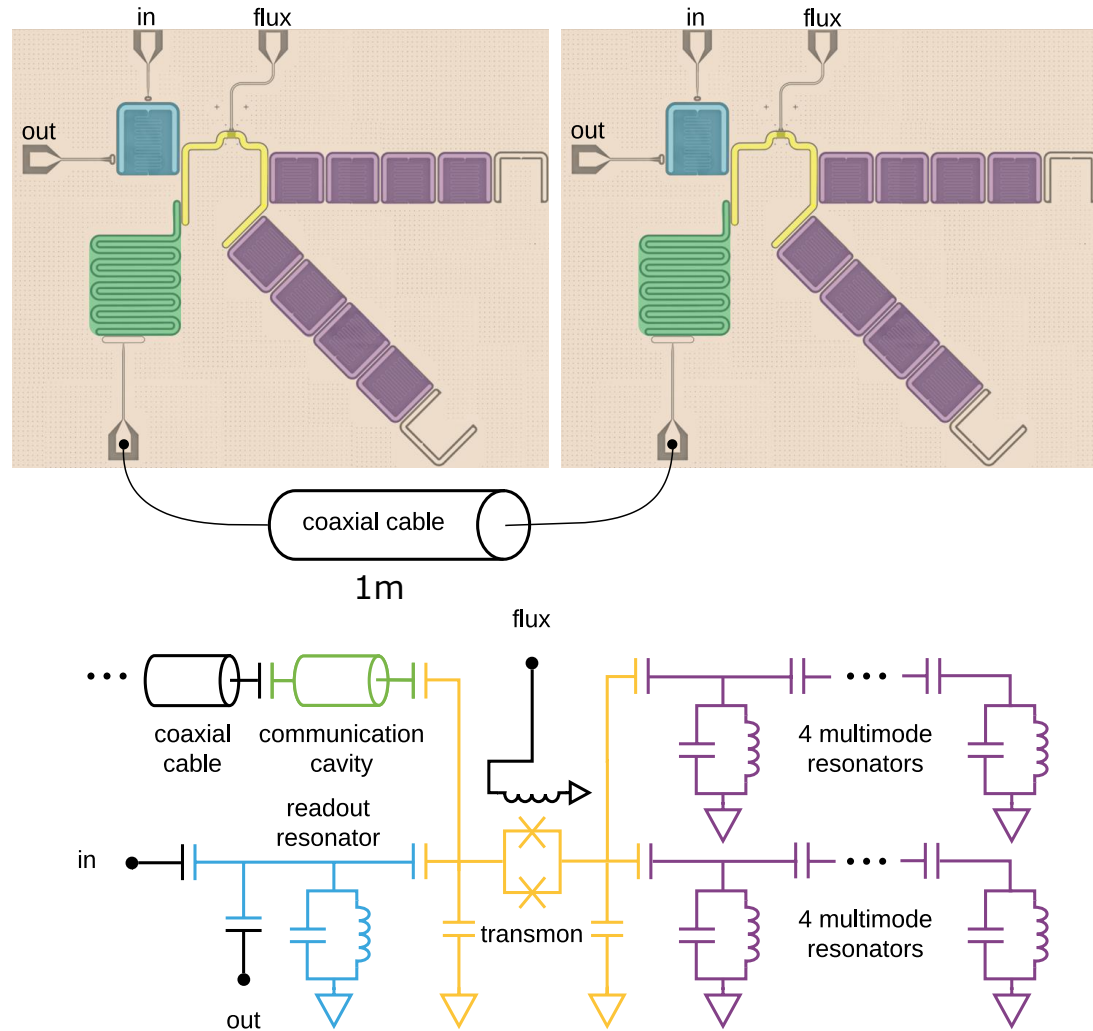

1 Transmon control

1 Measurement channel

8 data qubit modes

1 communication link

- ✓ Many photonic qubits
- ✓ Multiplexed control
- ✓ Universal Multimode Ops
- ✓ Modular architecture

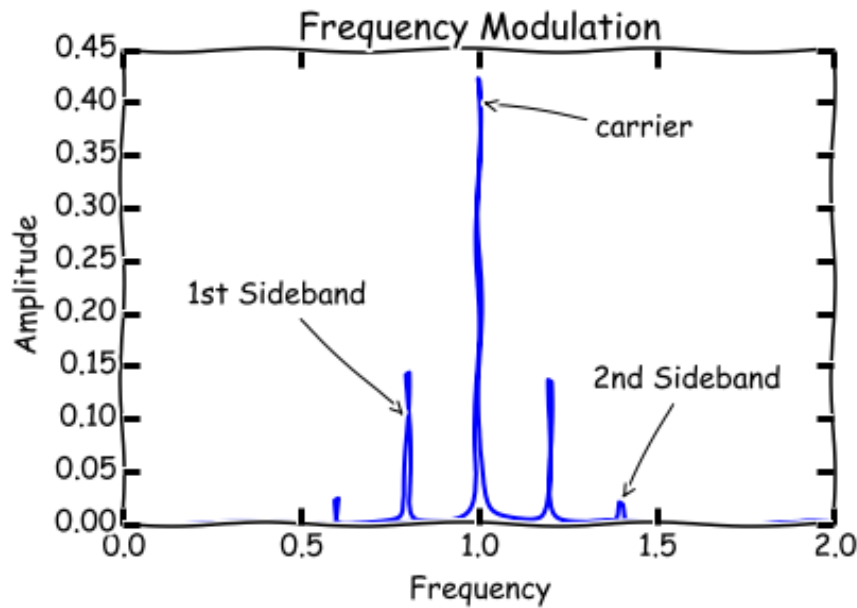

How does an FM radio work?

Carrier
Frequency

Modulation signal

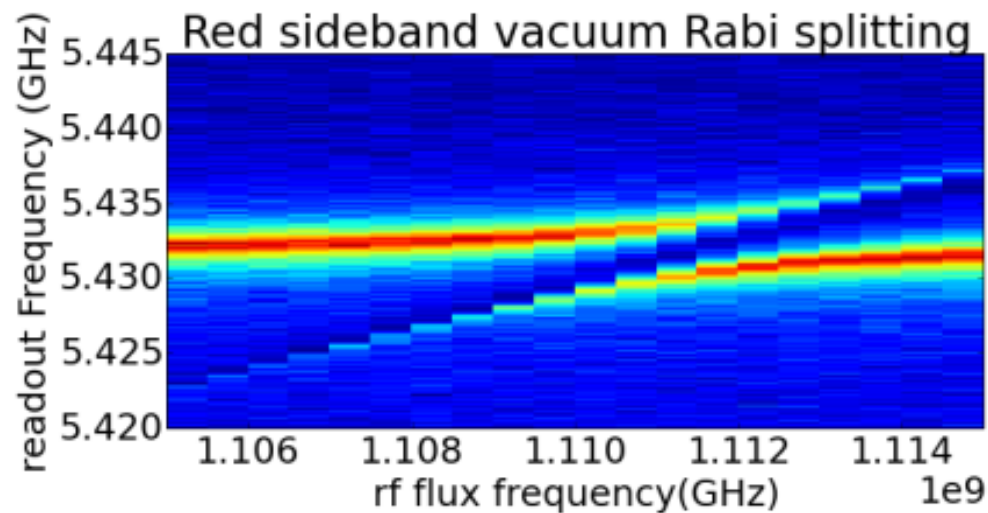

$$\sin \left(\omega_c t + \int_0^t \epsilon_m(\tau) d\tau \right)$$

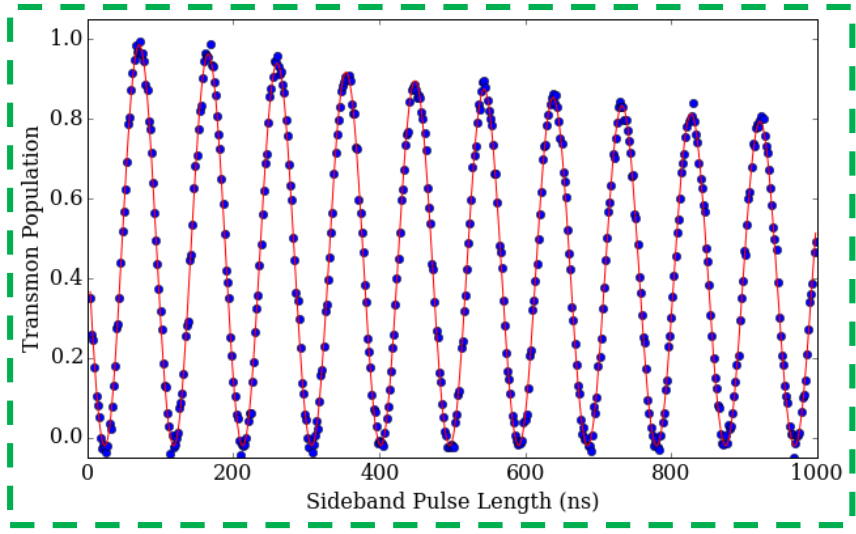

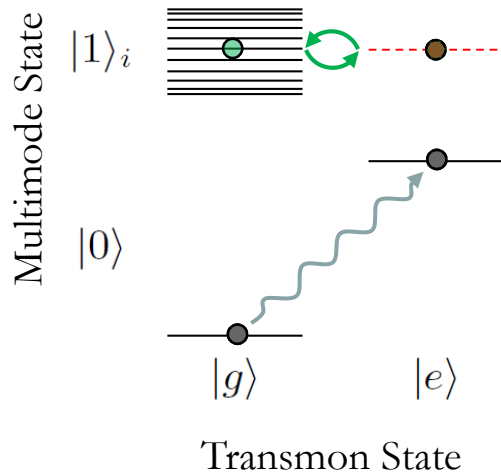

Stimulated Vacuum Rabi Oscillations

$$H_{int} = \frac{g_1}{2} (a^\dagger \sigma^- + a \sigma^+)$$

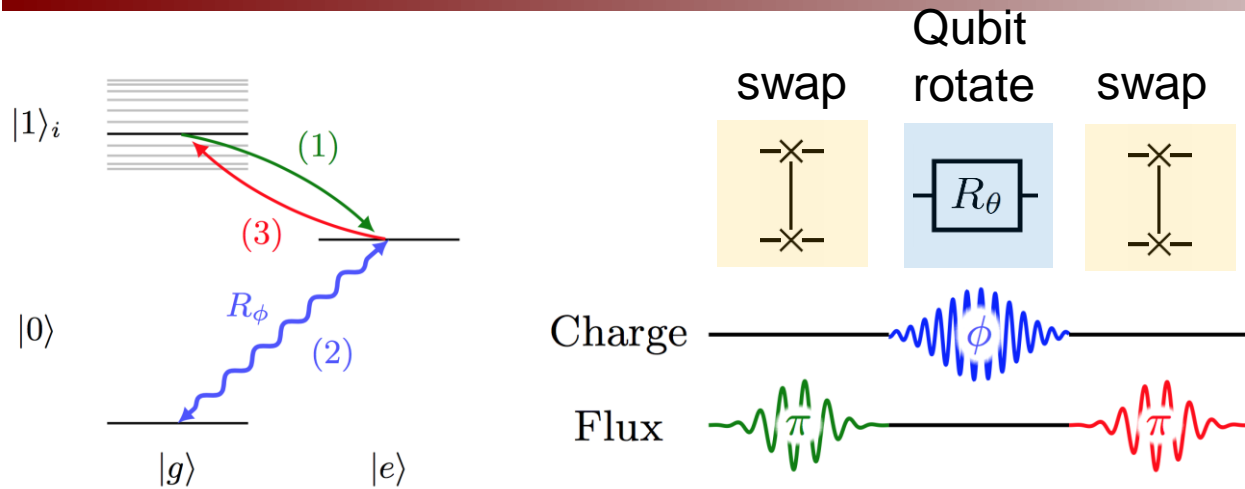

Stimulated Vacuum Rabi Oscillations

- We use a parametric drive to stimulate a vacuum Rabi Oscillation with any mode
- Address many modes with just a single transmon and set of controls

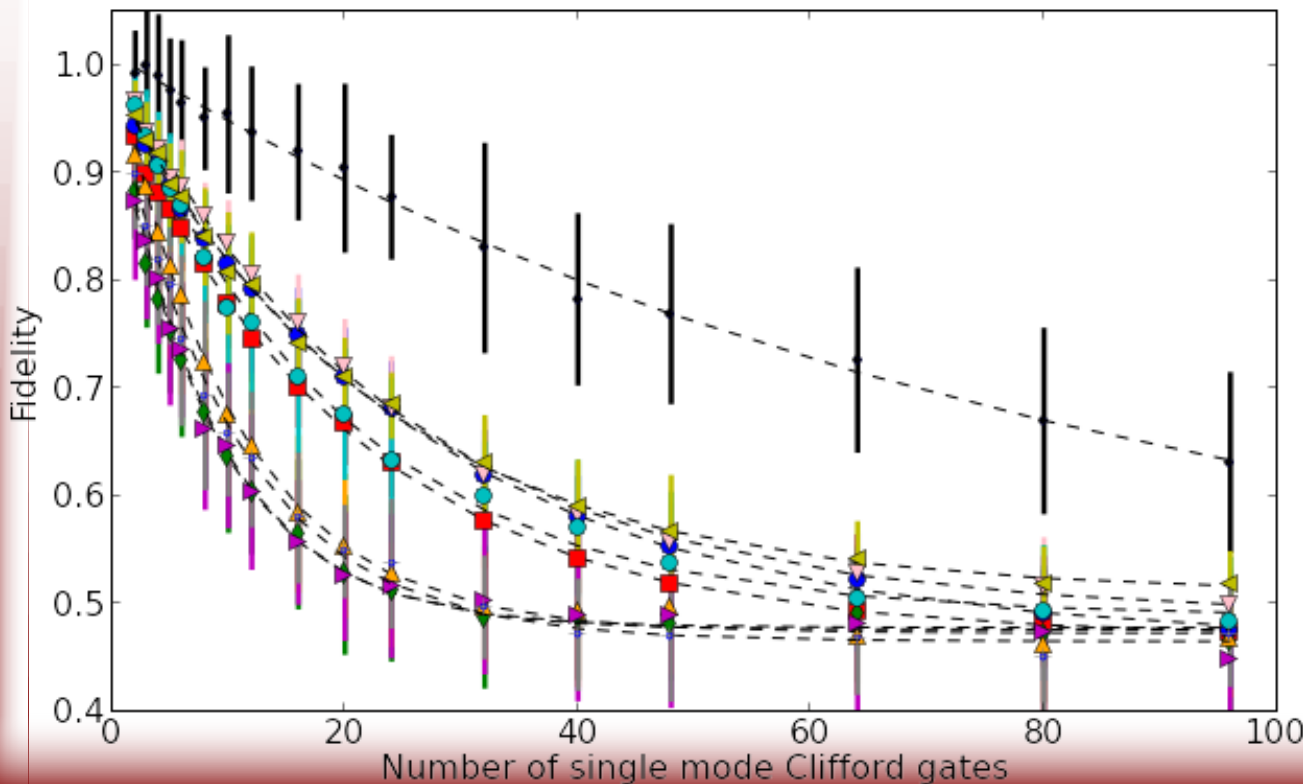

Randomized Benchmarking of light

Qubit: >98%

Cavity mode
Fidelity: 90-97%

†	†	RB qubit: 98.8%
■	■	mode 0: 95.3%
●	●	mode 1: 96.4%
◆	◆	mode 3: 89.3%
▲	▲	mode 4: 90.9%
▽	▽	mode 5: 96.0%
●	●	mode 6: 95.0%
▼	▼	mode 7: 89.4%
▲	▲	mode 9: 95.7%
†	†	mode 10: 91.0%

Anatomy of a multimode gate

CZ

$$\pi_{sb2}^{ge} + \pi_{sb1}^{ef} + \pi_{sb1}^{ef} + \pi_{sb2}^{ge}$$

Anatomy of a multimode gate

CZ

$$\pi_{sb2}^{ge} + \pi_{sb1}^{ef} + \pi_{sb1}^{ef} + \pi_{sb2}^{ge}$$

CNOT

$$\pi_{sb2}^{ge} + \pi_{sb1}^{ef} + \pi_q^{ef} + \pi_{sb1}^{ef} + \pi_{sb2}^{ge}$$

Anatomy of a multimode gate

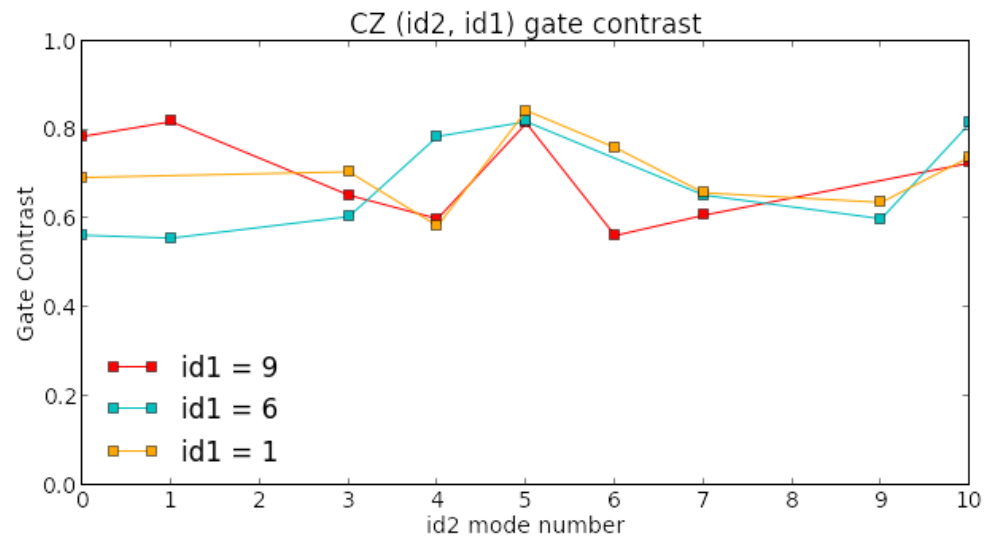

- Dispersive shift
- Stimulated AC Stark shift
- Qubit DC offset during Gate
- Working to model, compensate these higher order terms

Process tomography of multimode gates

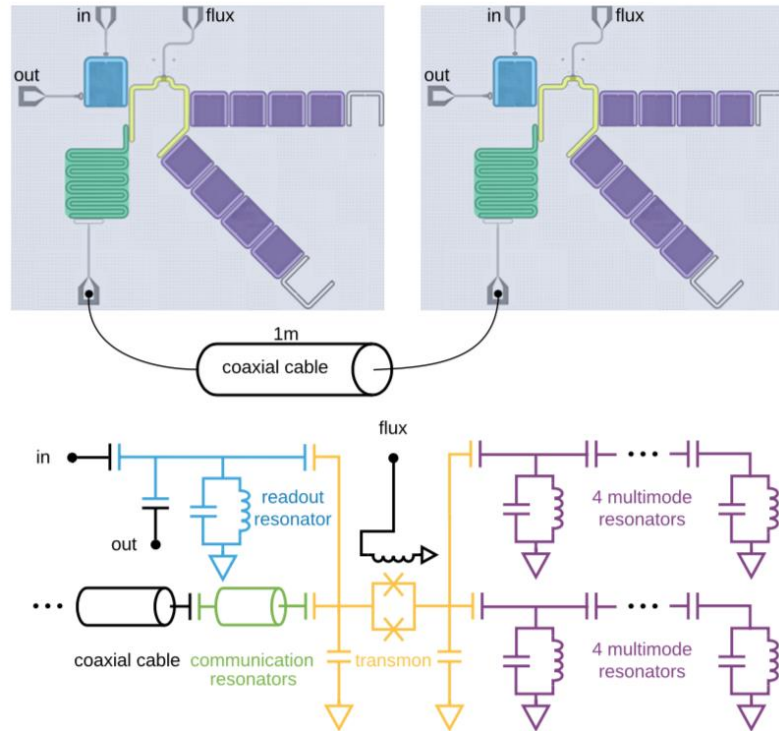

CZ

- Fidelity ~80% for gate

Shuttling single photons

Readout

Multimode Memory

Communication

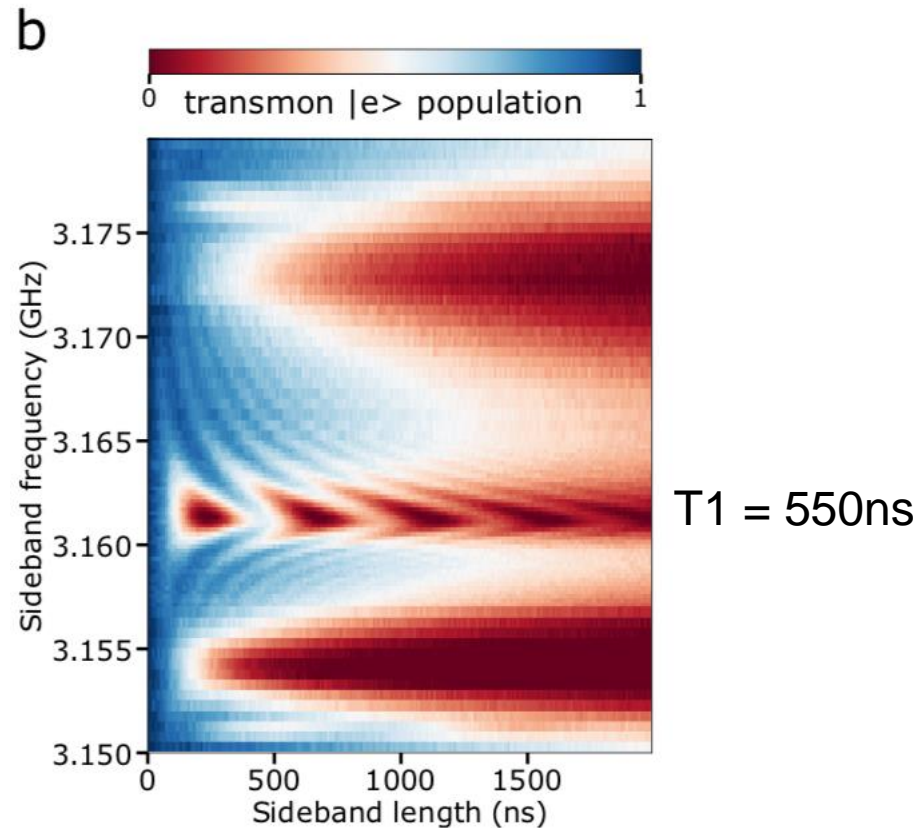

Everything is accessed with sideband swaps.

Communication looks just like memory!

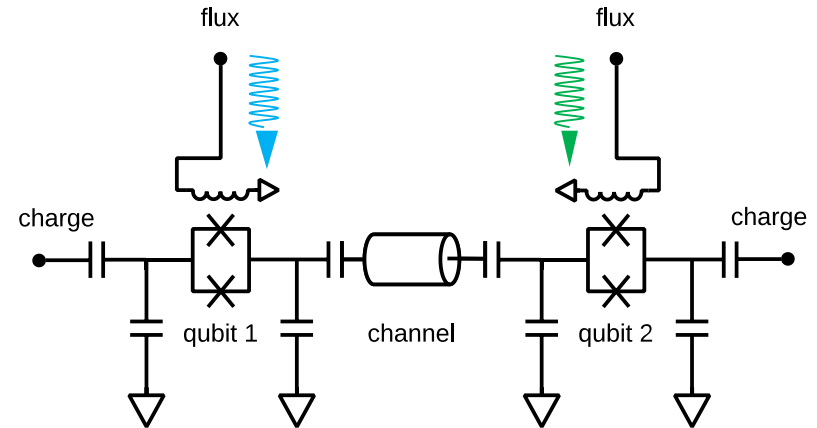

Low loss communication channel

Model as 3 modes in series
Comm – cable – Comm

Dark mode is protected against loss
in cable!

Bi-directional photon transfer

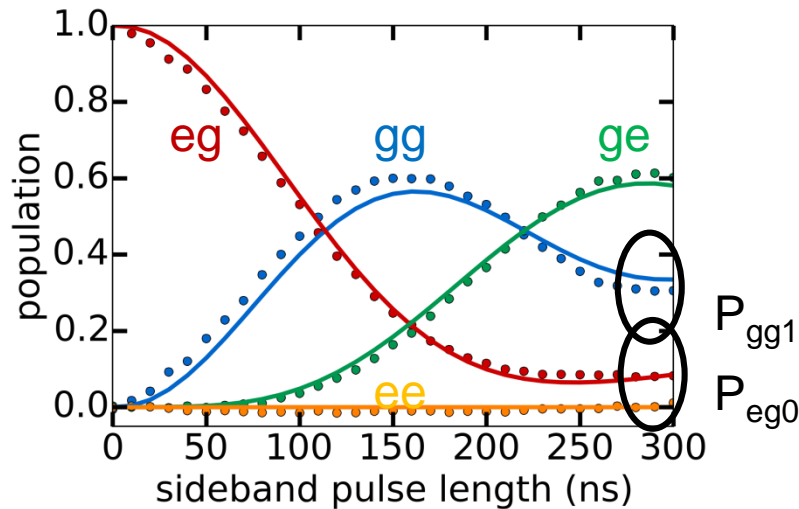

$|\text{qubit 1, qubit 2, channel}\rangle$

1. Put single photon in sender
2. Swap into “dark” mode
3. Swap into receiver

Can speed things up by sending and receiving simultaneously.

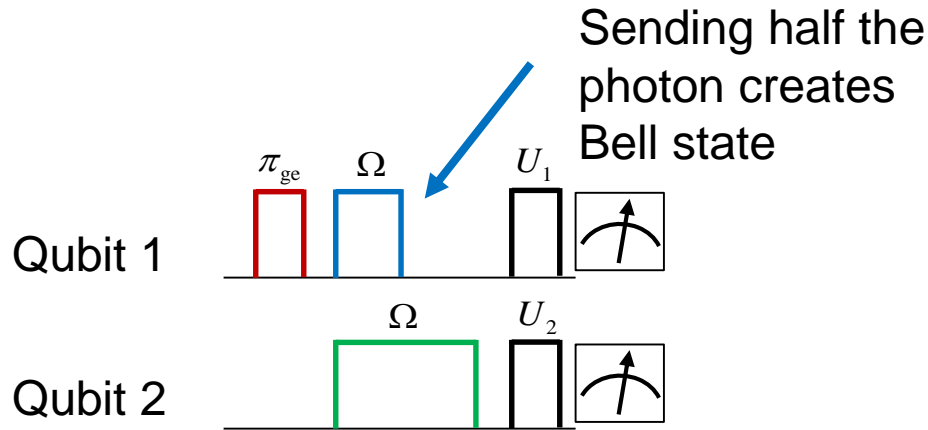

Bidirectional photon transfer

- 1 to 2 fidelity: $P_{ge0} \approx 61\%$
- Loss mechanism:
 - qubit and channel decay: $P_{gg0} \approx 24\%$
 - qubit dephasing: $P_{gg1} + P_{eg0} \approx 15\%$

- 2 to 1 fidelity: $P_{eg0} \approx 62\%$
- Loss mechanism:
 - qubit and channel decay: $P_{gg0} \approx 24\%$
 - qubit dephasing: $P_{gg1} + P_{eg0} \approx 14\%$

Bell state generation

- $F = \text{Tr}(\rho_{\text{Bell}} \cdot \rho_{\text{measure}}) = 0.793 \pm 0.002$
- Loss mechanism:
 - qubit and channel decay: 0.1
 - qubit dephasing: 0.1

Realizing higher Q - 3D modules

- A box with no seams.
- 10-50 Modes
- Engineered dispersion uniformly spaced (400MHz)

Conclusions

- Modular superconducting architecture with random access, reduced resources
- Universal quantum logic within a module
- Bi-directional coherent communication
~60% single photon fidelity
- Remote Bell state generation
~80% Bell state fidelity
- Higher Q 3D implementations soon
- Superconducting Qubits can be used directly as sensors
